

We are creating the CPS Mobile application. The goal is to have two main user types: Citizens and Police Force (with multiple roles within Police Force). The app will have a clear flow from the initial welcome screen to role-specific dashboards. Below, I will outline the entire flow in paragraphs, incorporating all the details you've provided.

App Flow Description

1. Welcome and Language Selection:

When the user opens the app for the first time, they are greeted with a welcome screen that has attractive, engaging animations. A prominent button labeled "Get Started" is present. Upon tapping, a modal screen appears in the middle of the phone screen, asking the user to choose their language. The language selection has a dropdown with a search bar. Once a language is chosen, the entire app's language changes accordingly.

2. Role Selection:

After language selection, the next screen asks, "Who are you?" with the Police Force crest and CPS app logo. The user must select their role to access the appropriate services. There are two large boxes: one for "Citizen" and one for "Police Force." The Citizen box has a green-themed icon (a user profile) and the word "Citizen" below it. The Police Force box has a blue-themed icon (a police badge) and the words "Police Force" below it. When the user taps one of the boxes, a border in the corresponding color (green for Citizen, blue for Police Force) appears around the selected box. A "Continue" button at the bottom becomes enabled and takes on the color of the selected role. Tapping "Continue" proceeds to the next step.

3. Citizen Flow:

If the user selects "Citizen," they are taken to a screen where they can either log in (if they have an account) or sign up. The sign-up process includes entering personal details (name, username, email, phone number, password, etc.) and verifying their identity (using NIN and a selfie). After successful registration or login, the user lands on the Citizen Dashboard.

Citizen Dashboard: This is the main hub for citizens. It includes:

From the dashboard, citizens can navigate to various screens to perform specific tasks, such as reporting a crime (with the help of the AI Crime Assistant), viewing case details, uploading evidence, etc.

4. Police Force Flow:

If the user selects "Police Force," they are taken to a role selection screen within the Police Force.

The roles are:

After selecting a specific police role, the user must log in or sign up (with appropriate verification for each role). Then, they are taken to their respective dashboard.

Police Dashboards:

Key Features Across the App:

Data Flow and Hierarchy:

The system is designed with a hierarchy: Citizens report to IO, who reports to OC Station, who reports to DPC. The Admin is separate and manages the system. Data flows accordingly, with each role having appropriate access.

Screens Summary:

The app will have the following screens (non-exhaustive list):

Design and Theming:

Conclusion:

The CPS Mobile app is a comprehensive platform that connects citizens and police, streamlining crime reporting, investigation, and communication. It is designed to be user-friendly, secure, and efficient, with role-specific interfaces and features. The app aims to increase trust in the police force by providing transparency and improving the efficiency of crime resolution.

This document serves as a high-level overview of the app's flow and features. Detailed design and technical specifications will follow in subsequent documents.

Complete CPS Mobile App Flow Explanation

Introduction to CPS Mobile

CPS Mobile is a revolutionary police-citizen safety application designed specifically for Uganda. The app transforms how crimes are reported, investigated, and resolved by creating a digital bridge between citizens and the Uganda Police Force. It addresses long-standing issues like corruption, slow response times, lost files, and lack of transparency in the justice system.

First-Time User Experience

When you open CPS Mobile for the first time, you're greeted with an engaging welcome screen featuring smooth animations that show police shields forming around the Uganda Police crest. These animations are designed to be visually appealing while conveying security and trust. A prominent "Get Started" button pulses gently, inviting you to begin. When you tap it, a modal window opens in the center of your screen with a clean interface asking you to "Choose Your Language." This isn't just a simple dropdown—it has a search bar so you can quickly find your preferred language from over 45 Ugandan languages. Once selected, the entire app instantly translates to that language, including menus, buttons, and instructions.

Role Selection - The Critical Choice

The next screen presents the most important question: "Who are you?" This determines your entire experience in the app. You see two beautifully designed boxes side by side. On the left is the Citizen box with a green-themed user profile icon and the word "Citizen" below it. On the right is the Police Force box with a distinctive police badge icon in a unique blue color (#0047AB) and "Police Force" below it. When you tap the Citizen box, it gets a glowing green border. When you tap Police Force, it gets a

blue border. The "Continue" button at the bottom changes color to match your selection—green for Citizen, blue for Police. This visual feedback ensures you know exactly what you've chosen.

Citizen Journey

If you select Citizen and continue, you reach the authentication screen where you can either login (if you already have an account) or sign up. The sign-up process is comprehensive but streamlined. You provide your full legal name, create a username, add your email and phone number, set a strong password, and answer a security question. Then comes verification: you enter your 14-digit National ID Number (NIN), take a selfie that gets compared with the NIRA database, select your district and parish, and accept the terms and conditions. Once verified, you're welcomed to CPS Mobile with your unique Citizen ID and taken to your dashboard.

The Citizen Dashboard is your command center. At the top is your profile picture and notification bell (showing how many alerts you have). Most prominently, there's a large red Emergency SOS button that you can press and hold for emergencies. Below this are eight quick-access buttons in a grid: Report Crime, My Cases, Evidence Vault, Safety Map, Community Alerts, Police Forms, Chat with Police, and Settings. Each button takes you to specialized screens designed for specific functions.

Reporting a crime activates the AI Crime Assistant—a smart chatbot that asks you questions about what happened, helps you describe it clearly, suggests the correct crime category, and helps you upload photos or videos. It then generates a professional police report automatically. The My Cases screen shows all your reported crimes with their current status—whether they're being investigated, if evidence is

being reviewed, or if they've been solved. You can tap any case to see detailed timelines, evidence, and chat with your assigned Investigating Officer.

The Evidence Vault is your secure digital locker where all your photos, videos, documents, and audio recordings are stored with military-grade encryption. Each piece of evidence gets a digital fingerprint (hash) and timestamp that proves it hasn't been tampered with. The Safety Map shows real-time crime hotspots in your area using color coding—red for high-risk areas, orange for medium, yellow for low, and green for safe zones. It can even suggest safer routes when you're traveling at night.

Community Alerts work like a TikTok feed but for safety information. You swipe vertically to see alerts about missing persons, stolen vehicles, traffic accidents, or wanted criminals. You can comment on alerts (to provide tips) and share them. The Police Forms Center eliminates the need to physically search for police forms—PF3 (medical examination), PF18 (lost property), PF24 (accident report), and others are available digitally. You fill them in the app, they get approved digitally by police, and you receive a QR-coded PDF.

Chat with Police is a secure messaging system that connects you directly with the officer handling your case. You can send text, photos, voice messages, or documents.

The system uses masked phone numbers to protect your privacy. The SOS Shield is your emergency panic button—holding it for 3 seconds sends your live location to the nearest three police stations, notifies your emergency contacts, starts audio recording, and calls 999 automatically.

Police Force Journey

If

Investigating Officers (IOs) are the detectives who handle cases. Their dashboard shows cases assigned to them, with priority levels and deadlines. They can review citizen evidence, upload their own evidence (like crime scene photos), update case status, and chat with victims and witnesses. They use specialized tools for evidence analysis, timeline building, and report generation.

Officer-in-Charge (OC Station) manages an entire police station. Their dashboard shows all cases at their station, officer performance metrics, resource availability (vehicles, fuel), and pending tasks. They can assign cases to specific IOs, broadcast alerts to their station's officers, and monitor investigation progress. They have a drag-and-drop case assignment board that works like a Kanban system.

District Police Commander (DPC) oversees multiple stations in a district. Their dashboard shows district-wide crime statistics on an interactive map, performance comparisons between stations, and approval queues for police forms. They can broadcast alerts to the entire district, approve or reject forms digitally, and monitor resource deployment across stations.

System Admin (CPS Admin) is the technical backbone of the system. They manage user accounts, system configuration, security settings, and integrations. They approve DPC accounts, verify police station registrations, monitor system health, and ensure data security. Importantly, admins cannot access case details or evidence—they only manage the system infrastructure.

The Hierarchy and Workflow

The system follows a clear hierarchy: Citizens report crimes to the system. Cases are automatically routed to the appropriate police station based on location. The Station OC assigns the case to an Investigating Officer. The IO investigates, collects evidence, and communicates with the citizen. Complex cases or those requiring resources might be escalated to the DPC. The DPC oversees the district and approves important forms. Throughout this process, citizens can track every step in their app, and police have all the digital tools they need for efficient investigation.

Key Innovations

What makes CPS Mobile revolutionary is several key innovations: The AI Crime Assistant that helps people describe crimes accurately; the Evidence Vault with blockchain-like tamper-proofing; Real-time crime heatmaps that help both citizens avoid danger and police deploy resources; Community Alerts that turn every citizen into extra eyes and ears for police; and Complete digital workflows that eliminate paper, reduce corruption, and speed up justice.

Accessibility and Inclusion

The app is designed for all Ugandans. For those without smartphones, there's a USSD code (*288#) and SMS system. For the illiterate, there's voice navigation and text-to-speech. For the visually impaired, there's screen reader compatibility. For non-tech-savvy users, there are simple interfaces with large buttons. Local Council (LC) chairs get a simplified version to help their communities report crimes.

Security and Privacy

Every communication is end-to-end encrypted. Citizen identities are protected—especially for GBV victims and witnesses. Police cannot see your personal details unless you choose to share them. Evidence is stored with multiple layers of security. The system is regularly audited for security compliance.

Impact on Uganda's Justice System

CPS Mobile transforms a typically slow, paper-based, and opaque justice process into a fast, digital, and transparent system. Citizens no longer need to travel to police stations multiple times or pay bribes to get services. Police can solve cases faster with digital evidence and tools. The judiciary receives complete digital case files. Overall, it builds trust between police and citizens while making Uganda safer.

The app represents a new era of community policing in Uganda—where every citizen becomes a partner in safety, and every police officer has the digital tools to serve effectively. From the moment you see that welcoming animation to when you track your case through to court resolution, CPS Mobile ensures you're informed, protected, and empowered throughout the justice journey.

Sign-up and Login Processes

For Citizens:

Sign-up:

When a citizen selects the "Citizen" role and taps "Continue," they are taken to the sign-up screen. The sign-up process is designed to be secure and thorough, ensuring that each user is verified and authentic. The steps are as follows:

1. **Personal Information:** The citizen enters their full legal name (as per National ID), chooses a username, provides an email address, and enters a Ugandan phone number. They then create a strong password and confirm it.
2. **Security Information:** They select a security question and provide an answer for account recovery. They can also optionally add an emergency contact (name and phone number).
3. **Verification:** The citizen enters their 14-digit National Identification Number (NIN). The system verifies the NIN with the National Identification and Registration Authority (NIRA) database. Once the NIN is verified, the citizen is prompted to take a selfie. The selfie is compared with the photo in the NIRA database to ensure the person is the legitimate holder of the NIN.
4. **Location and Terms:** The citizen selects their district and parish/village of residence. They then agree to the Terms and Conditions and Privacy Policy, which include a declaration that providing false information is a criminal offense.
5. **Account Creation:** After successful verification, the account is created. The citizen receives a unique Citizen ID (e.g., CPS-CTZ-2025-000123) and is taken to the dashboard.

Login:

Registered citizens can log in using their phone number, email, or username along with their password. They can also enable biometric login (fingerprint or face recognition) for faster access.

For Police Force:

When a user selects the "Police Force" role, they are taken to a second role selection screen where they choose their specific role: Investigating Officer (IO), Officer-in-Charge (OC Station), District Police Commander (DPC), or System Admin (CPS Admin). Each role has a tailored sign-up and login process.

General Police Sign-up (for all roles except Admin):

1. **Role Selection:** The officer selects their role (IO, OC Station, or DPC).

2. **Verification of Police Identity:** The officer enters their service number, badge number, and station code. The system verifies these details against the Uganda Police Force database.
3. **Personal Information:** They provide their full name, email, and phone number. They also set a password.
4. **Superior Officer Approval:** For IO and OC Station roles, the sign-up requires approval from a superior officer (entering a verification code provided by the superior). For DPC, the sign-up requires approval from the System Admin.
5. **Account Activation:** Once approved, the account is activated, and the officer can log in.

System Admin Sign-up:

System Admin accounts are created by existing admins or by a special technical team. They are not open for self-registration.

Police Login:

Police officers log in using their service number or email and password. They must also pass a two-factor authentication (2FA) step, which can be an OTP sent to their registered phone or email, or a biometric verification.

Dashboard Features for Each User Type

Citizen Dashboard:

The Citizen Dashboard is designed to be a one-stop hub for all safety and crime reporting needs.

The main features include:

- **Emergency SOS Button:** A large, red button that, when held for 3 seconds, triggers an emergency alert. It sends the citizen's live location to the nearest police stations, notifies their emergency contacts, and starts audio recording.

- **Report Crime:** This opens the AI Crime Assistant, which guides the citizen through reporting a crime with structured questions and evidence upload.
- **My Cases:** Displays all the crimes reported by the citizen, with their current status (e.g., under investigation, closed). Tapping a case shows detailed timeline, evidence, and chat with the assigned Investigating Officer.
- **Evidence Vault:** A secure, encrypted storage for all evidence (photos, videos, documents) related to their cases. The evidence is tamper-proof and time-stamped.
- **Safety Map:** An interactive map showing crime hotspots (heatmap) and safe routes. It also alerts the citizen when they enter a high-risk area.
- **Community Alerts:** A feed of real-time alerts from the police and community about missing persons, stolen vehicles, traffic, riots, etc. It allows commenting and sharing.
- **Police Forms:** Digital versions of police forms (PF3, PF18, etc.) that can be filled, submitted, and approved within the app.
- **Chat with Police:** A secure chat interface for communicating with the Investigating Officer assigned to their case.
- **Settings:** Account and app settings, including emergency contacts, notification preferences, and language.

Investigating Officer (IO) Dashboard:

The IO Dashboard is tailored for detectives handling cases. Key features:

- **My Cases:** A list of cases assigned to the IO, with priority levels and deadlines. They can filter and sort cases.
- **Case Details:** For each case, the IO can view the citizen's report, evidence, timeline, and chat with the citizen. They can update the case status, add notes, and upload additional evidence.
- **Evidence Manager:** Tools to review and organize evidence, including face recognition, license plate recognition, and document analysis.

- **Chat with Citizens and Witnesses:** Secure communication with citizens and witnesses involved in their cases.
- **Report Generator:** Templates for creating investigation reports, which can be submitted to the OC Station or DPC.
- **Resource Request:** Option to request additional resources (like forensic teams) for a case.
- **Alerts:** Notifications about new cases, updates from citizens, or messages from superiors.

Officer-in-Charge (OC Station) Dashboard:

The OC Station Dashboard focuses on managing the police station and its personnel. Features include:

- **Station Overview:** Statistics on total cases, solved cases, active cases, and officer performance.
- **Case Assignment:** A board (Kanban style) to assign cases to IOs and track their progress.
- **Officer Management:** View and manage the IOs in their station, including their workload and performance.
- **Resource Management:** Monitor station resources (vehicles, equipment) and allocate them as needed.
- **Alerts Broadcast:** Send alerts to all officers in the station or to specific departments.
- **Form Approval:** Approve or reject police forms (like PF3, PF18) submitted by citizens or IOs.

District Police Commander (DPC) Dashboard:

The DPC Dashboard provides a district-wide view and control. Features:

- **District Overview:** A map showing crime hotspots and police stations in the district. Statistics on crime rates, response times, and case resolutions.
- **Station Performance:** Compare the performance of different stations in the district.
- **Form Approval:** Approve or reject forms that require district-level approval.

- **District Broadcast:** Send alerts to all stations and citizens in the district.
- **Resource Allocation:** Allocate resources (like additional officers or equipment) to stations as needed.
- **Escalated Cases:** View and handle cases escalated from stations.

System Admin (CPS Admin) Dashboard:

The System Admin Dashboard is for technical management of the CPS system. Features:

- **System Health:** Monitor server status, database performance, and API response times.
- **User Management:** Manage user accounts (approve DPC accounts, verify station registrations, suspend accounts, reset passwords).
- **System Configuration:** Configure app settings, security settings, and integrations (like NIRA, hospitals, courts).
- **Security Monitoring:** View security logs, detect suspicious activities, and manage encryption keys.
- **Analytics:** View anonymous usage statistics and generate reports for system improvement.
- **Backup and Recovery:** Manage data backups and disaster recovery plans.

Conclusion

The CPS Mobile app is designed to be intuitive and powerful for each user type. The sign-up and login processes ensure security and verification, while the dashboards provide tailored tools for citizens and police to work together effectively. This comprehensive system aims to transform crime reporting and investigation in Uganda, making it faster, more transparent, and more efficient.

Sign-Up & Login Processes for All Users

Citizen Sign-Up Process

When a citizen chooses the green "Citizen" box and clicks continue, they begin a secure registration process designed to verify their identity while protecting their privacy. First, they provide basic personal information: their full legal name exactly as it appears on their National ID, a unique username they'll use for logging in (like @john_doe2025), a valid email address for account recovery and updates, and their Ugandan phone number starting with +256. They create a strong password with at least 8 characters including uppercase, lowercase, numbers, and special symbols. Next comes security setup—they choose a security question (like "What was your first pet's name?") and provide an answer for account recovery. They can optionally add an emergency contact who will be notified during SOS situations.

The verification stage is where CPS ensures truthfulness. Citizens must enter their 14-digit National Identification Number (NIN) starting with "CF." The system instantly verifies this with the National Identification and Registration Authority (NIRA) database. Once verified, the citizen takes a selfie using their phone's camera—this photo is compared with their NIN photo using facial recognition AI to confirm they're the legitimate ID holder. They then select their district and parish/village of residence, which helps route their reports to the correct police station. Finally, they accept the Terms and Conditions, which include a legal declaration that providing false information is a criminal offense under Section 115 of Uganda's Penal Code Act. Upon completion, they receive a unique Citizen ID (like CPS-CTZ-2025-000123) and immediate access to their dashboard.

Police Force Sign-Up Process

When someone selects the blue "Police Force" box, they're taken to a specialized police role selection screen showing four options, each requiring different levels of

verification. For Investigating Officers (IOs), registration requires their police service number, badge number, station code, and rank. The system verifies these against the Uganda Police Force's personnel database. They must also provide a supervisor's verification code to prevent impersonation. For Officer-in-Charge (OC Station), they register their station with official station code, location coordinates, and district command approval. District Police Commanders (DPC) require ministry-level verification codes and district authorization. System Admins are created by existing admins only—there's no public registration for this role.

All police registrations include biometric verification—either fingerprint or facial recognition—that matches with existing police records. They also undergo two-factor authentication setup, receiving verification codes via both SMS and official police email. Each police role has specific access permissions coded into their account, ensuring an IO can't access DPC functions and vice versa. The system maintains a clear audit trail of which superior officer approved each registration, creating accountability throughout the chain of command.

Login Systems for All Users

Every user—whether citizen or police—logs in using a unified system with multiple security layers. The primary login method is username/email/phone number combined with password. However, CPS Mobile offers three enhanced login options for convenience and security. First is biometric login using fingerprint or face recognition—especially useful for quick access during emergencies. Second is PIN login, where users set a 6-digit PIN for faster access than typing passwords. Third is pattern unlock, drawing a specific pattern on a 3x3 grid.

For added security, the system implements two-factor authentication (2FA) for all police accounts and optional for citizens. After entering their password, they receive a one-time code via SMS or authenticator app. The system also includes device recognition—if you try to log in from a new device, you must verify via email or existing device. Session management automatically logs out inactive users after 15 minutes, and shows all active sessions in the security settings, allowing users to remotely log out suspicious sessions.

Citizen Dashboard Features

The Citizen Dashboard is designed as a personal safety command center. At the very top sits the Emergency SOS Shield—a large red button that, when pressed and held, triggers immediate police response, shares live location, notifies emergency contacts, and starts automatic recording. Just below, a Quick Action Grid provides one-tap access to eight essential functions. The Report Crime button activates the AI Crime Assistant, which guides users through describing incidents, asking intelligent follow-up questions, and helping upload evidence. My Cases shows all reported crimes with color-coded status indicators—blue for investigation, yellow for evidence review, green for solved, and red for urgent attention.

The Evidence Vault displays all uploaded files with security badges showing which are "sealed" (tamper-proof) and which are pending. The Safety Map shows real-time crime hotspots around the user's location, with route safety suggestions for navigation. Community Alerts shows a live feed of police announcements, missing person alerts, and community warnings in a TikTok-style vertical scroll format. Police Forms provides digital versions of all necessary forms—PF3 for medical exams after assault, PF18 for lost property, PF24 for accidents—with auto-fill features from the user's

profile. Chat with Police shows active conversations with investigating officers, with unread message counts. Settings manages account security, notification preferences, and emergency contact setup.

A Recent Activity section below the main grid shows timeline updates: "Case #001 updated to 'Investigation in Progress'," "New alert: Missing child in your area," "Message from IO: Please upload additional photos." There's also a Safety Score indicator showing how safe their current location is based on recent crime data, and Quick Tips that change daily: "Secure your phone in crowded markets," "How to recognize pickpockets," etc.

Investigating Officer (IO) Dashboard Features

The IO Dashboard is built for efficiency in field investigations. The central feature is the Case Queue showing all assigned cases sorted by priority—red for high priority (violent crimes, in-progress situations), yellow for medium (theft, property crimes), and green for low (lost property, minor incidents). Each case card shows victim name, crime type, days since report, and next action needed. The Today's Tasks section lists specific actions: "Interview witness for Case #045," "Collect CCTV for Case #067," "Submit evidence package for Case #023."

Evidence Management Tools allow IOs to review citizen-uploaded evidence, add their own crime scene photos and videos, record witness statements, and organize everything by case. AI Assistance suggests investigation steps: "Check previous similar cases in this area," "Verify suspect's alibi with location data," "Request phone records from telecom." The Communication Hub shows all active conversations with victims, witnesses, and other officers, with priority flags for urgent messages.

Resource Request buttons allow IOs to quickly request backup, forensic teams, or specialized equipment.

Performance Metrics show their clearance rate (percentage of cases solved), average investigation time, and citizen satisfaction ratings. Legal Reference provides quick access to relevant laws, procedures, and required forms for different crime types. Field Tools include barcode scanning for evidence logging, voice-to-text for note taking, and offline mode for areas without internet.

Officer-in-Charge (OC Station) Dashboard Features

The OC Station Dashboard focuses on station management and oversight. The Station Overview shows key metrics: total active cases, solved cases this month, average response time, and officer utilization rates. The Case Assignment Board uses a Kanban-style drag-and-drop interface showing cases in columns: New Reports, Needs Assignment, Investigation, Evidence Review, and Court Ready. The OC can drag cases to specific IOs or departments.

Officer Management shows all IOs in their station with performance indicators—cases handled, success rates, and workload balance. Resource Dashboard monitors station vehicles (available/assigned/maintenance), fuel levels, equipment inventory, and supply needs. Alerts Center allows broadcasting messages to all station officers or specific teams, with templates for common situations: "All units: Be on lookout for stolen Toyota Wish," "Patrol teams: Increased robbery reports in Market area."

Form Approval Queue shows all pending forms requiring their signature—PF3s, PF18s, release forms—with quick Approve/Reject/Request Changes options. Station Analytics provides insights into crime patterns in their jurisdiction, peak crime hours, and

hotspot locations needing increased patrols. Communications Log tracks all station broadcasts and public alerts sent.

District Police Commander (DPC) Dashboard Features

The DPC Dashboard provides strategic oversight across multiple stations. The District Heatmap shows crime distribution across their entire district with interactive filtering by crime type, time period, and severity. Station Performance Comparison ranks all stations in their district by key metrics: response times, case clearance rates, and citizen satisfaction scores.

Resource Allocation Tools help distribute personnel, vehicles, and equipment across stations based on need and crime trends. Form Approval System handles district-level forms requiring DPC authorization, with bulk approval capabilities and audit trails. District Broadcast Center allows sending alerts to all stations and citizens in their district simultaneously, with scheduling options for curfews, event security, and weather warnings.

Trend Analysis shows crime pattern predictions based on historical data, seasonal variations, and emerging threats. Budget Monitoring tracks resource expenditures across stations and identifies areas needing additional funding. Inter-Station Coordination facilitates collaboration between stations for cross-jurisdiction cases and joint operations.

System Admin (CPS Admin) Dashboard Features

The System Admin Dashboard manages the technical infrastructure without accessing case details. System Health Monitor shows server status, database performance, API

response times, and user concurrency in real-time. User Management Console allows approving/rejecting DPC registrations, verifying police station accounts, suspending compromised accounts, and managing role permissions.

Security Dashboard monitors for suspicious activities—multiple failed logins, unusual access patterns, potential breach attempts—with automated lockdown protocols.

Configuration Management controls system settings: file size limits, supported evidence formats, notification rules, and integration settings with NIRA, hospitals, and courts.

Backup & Recovery Systems manage automatic backups, disaster recovery protocols, and data restoration procedures. Analytics Portal provides anonymous usage statistics—number of reports per district, system adoption rates, feature usage patterns—for system improvement without compromising privacy. Update Deployment manages app version releases, patch deployments, and system maintenance schedules.

The Dashboard Philosophy

Each dashboard is intentionally designed with the user's primary responsibilities in mind. Citizens get tools for reporting and tracking. IOs get investigation management tools. OCs get station operation tools. DPCs get strategic oversight tools. Admins get system maintenance tools. This role-specific design ensures everyone has exactly what they need without unnecessary complexity, making the system efficient for beginners while powerful enough for experts. The consistent color coding—green for citizen features, blue for police features—helps users intuitively understand what

they're interacting with, creating a seamless experience from crime report to case resolution.
